

- Bits of DNA from dying cells are taken up by recipient cells through the process of transformation
- Viruses pick up DNA from one cell to another cell through the process of transduction
- Two cells exchange DNA by direct contact through the process of conjugation
- Bacteria can form thick-walled endospores to survive harsh conditions
- Bacteria reproduces asexually through binary fission where a single cell divides into two
- Proteobacteria include heterotrophic facultative anaerobes that live in our intestines, and autotrophs that contain energy from sulfur
- Cyanobacteria were the first cells to release oxygen gas as a byproduct of photosynthesis
- Obligate aerobes need oxygen to survive
- Obligate anaerobes can only live in habitats that lack oxygen
- Facultative anaerobes can live with or without oxygen
- Bacteria can make medicines, foods, and breakdown organic materials in wastewater

Questions

1. The flagella are used for? Locomotion, adhering to other cells, Exchanging DNA, Evading the immune system- **Locomotion**
 2. The Cell wall of bacteria is made up of? Cellulose, Chitin, Peptidoglycan, Glycocalyx- **Peptidoglycan**
 3. What Bacteria shape is a rod shape? Coccus, Spirillum, Bacillus, Vibrio- **Bacillus**
-

3 / 3

4. Viruses picking up DNA from one cell to another is called? Transformation, Conjugation, Transduction, Transfection- **Transduction**
5. Bacteria reproduces by? Binary Fission, Spores, Fragmentation, Sexual reproduction- **Binary Fission**
6. Bacteria living in an animal's digestive tract would be? Obligate aerobe, Obligate anaerobes, Facultative anaerobe, Aerotolerant anaerobe- **Obligate Anaerobes**
7. Which one of these benefits does bacteria not have? Make medicine, make food, remove organic material from wastewater, provides nutrients- **Provides nutrients**
